Synthetic tissue: all donor positions, including the other hemisphere

Seed 101; BASE; first target (family 0, twin 0), chosen by index rather than score.
Orange box: fill / evaluation region. Same grayscale (60-140) for all intensities.
*Other side at corresponding coordinates in this model, already aligned; not a flipped copy of the target.
Outside the box: original target. Threshold segmentation; synthetic fields, not real MRI or FastSurfer.
