Synthetic eye | original → population mean

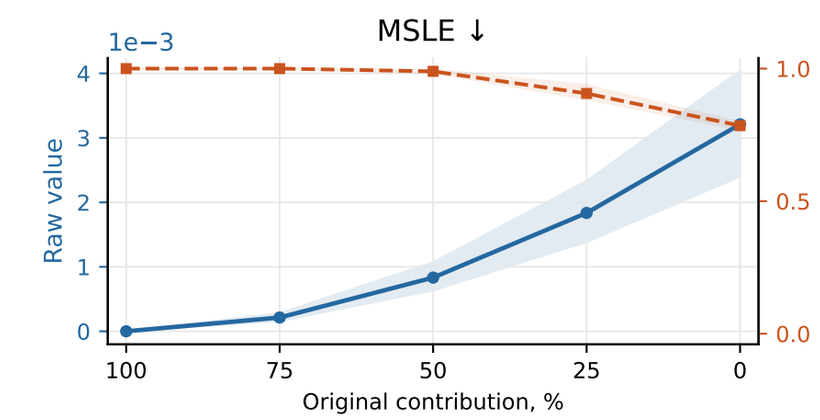

Raw metric (left axis) Stranger-calibrated c (right axis)

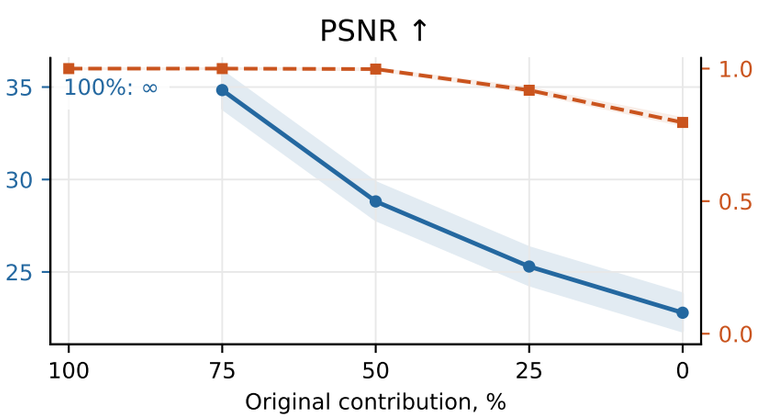

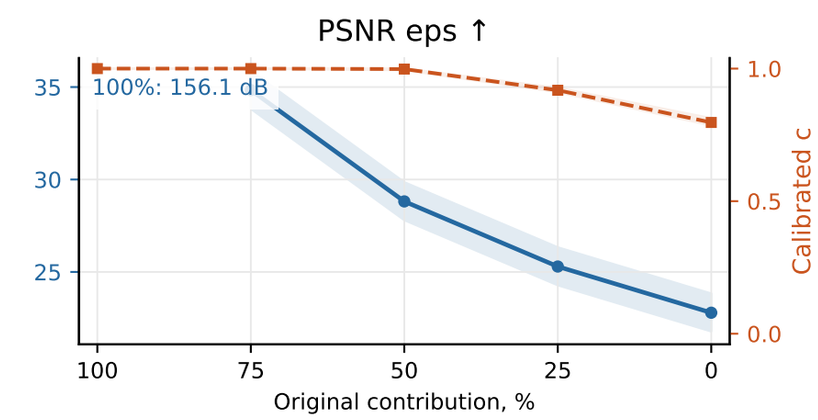

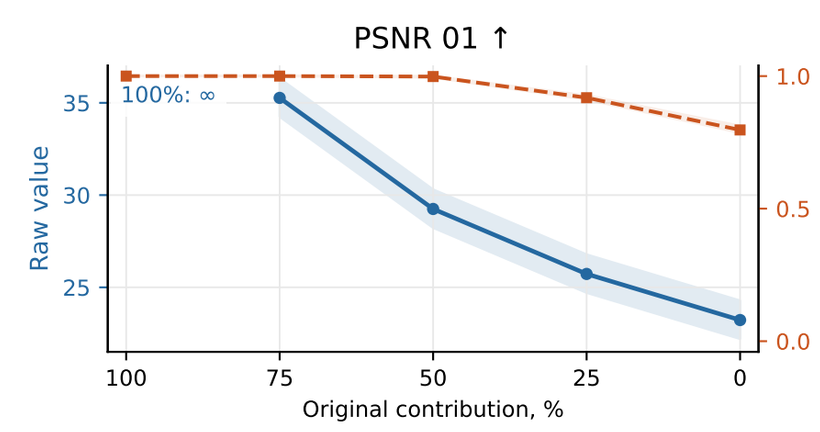

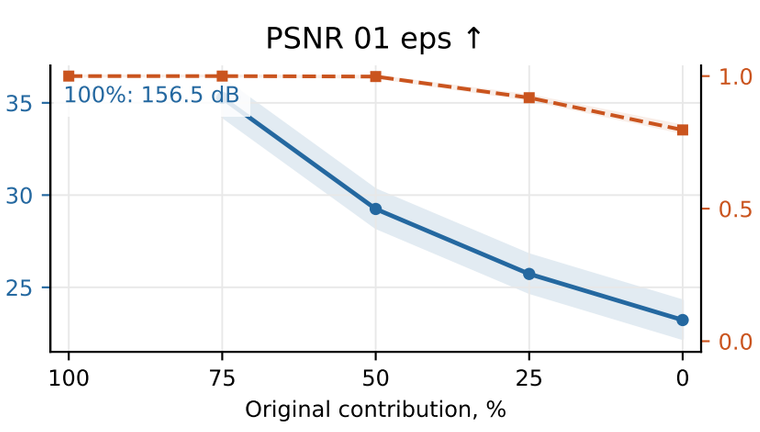

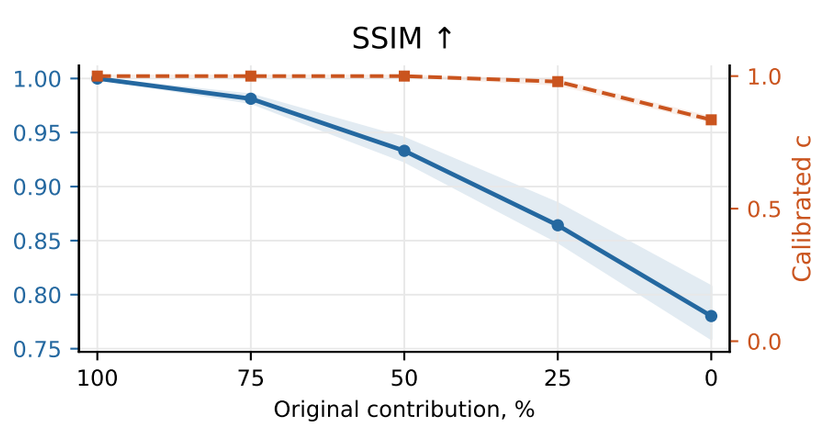

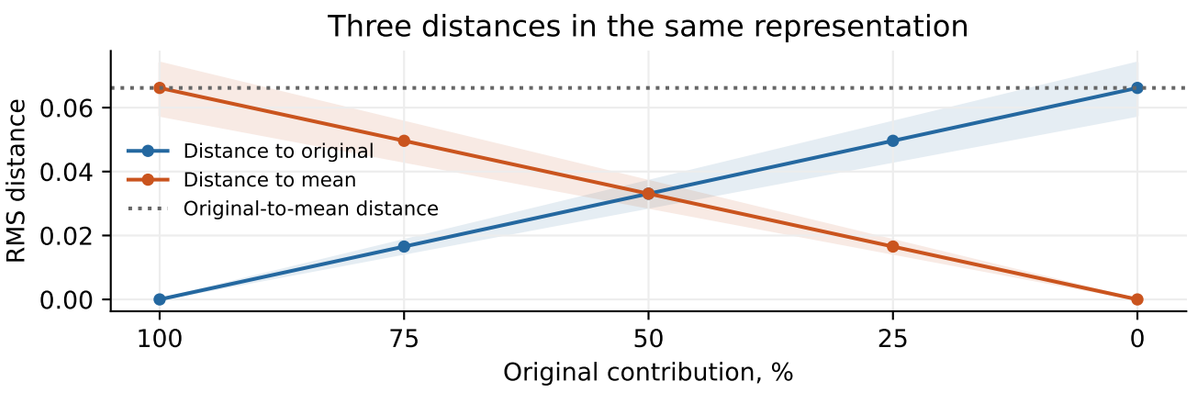

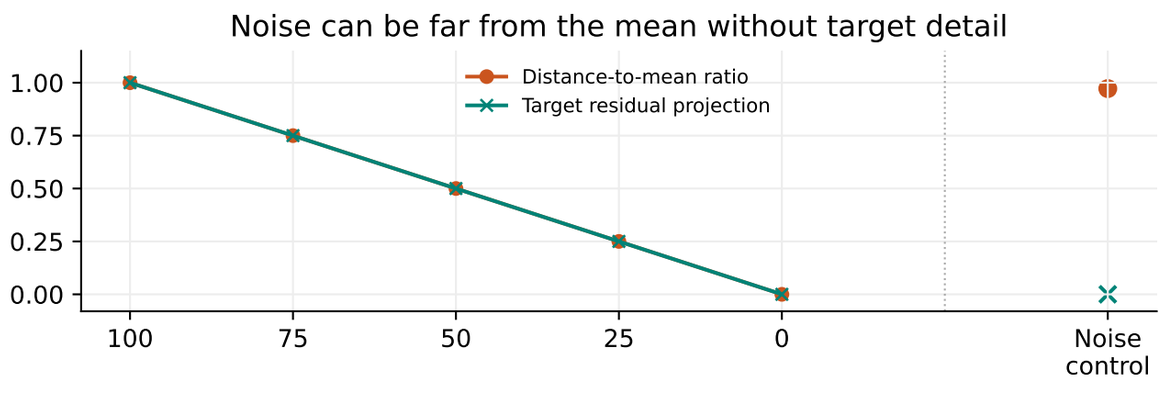

Images: seed 401, first target. Curves: 24 targets / 3 seeds; bands: min–max of seed means, NOT confidence intervals.
y = lambda × original + (1-lambda) × mean. Same ROI and grayscale across all five steps. PSNR oracle values are printed; blue PSNR axes show 75%–0%.
Mean-control curves equal lambda by construction; this is a diagnostic, not validation of a final identity score. Noise is orthogonal and norm-matched before nonnegative clipping.
