Synthetic tissue: corresponding tissue, alternative donors and population mean

Orange: target region. Teal: the corresponding location in the other hemisphere.

Bilateral arrangement is schematic; independent side component, already in target coordinates.

Seed 401, first target of the saved 24-target tissue experiment; prior 0.25. Synthetic threshold masks, not MRI segmentation.
Mean: 40 independent template families; 24 reference families. Image and all controls use the same original and ROI.
